Export GIF with bg color 0.1

This script brings up the Gif Optimizer dialog and sets the blend color for partially transparent pixels to the current background color. If that's something you do a lot you might find it a useful timesaver. If not, you might find it useful as an example of how to bring up PSP dialogs with parameters filled in from computed values. In that sense it could be considered a kind of 'dynamic preset' where the parameters are not constant but chosen based on the current situation.

Installation instructions:

Download the script. Place the script in your Scripts-Trusted folder (required in order to use the Gif Optimizer)..

To Run:

Open or create a new image. Select the Export Gif with bg color script in the scripts list and press play.
